### Description

15

20

25

35

40

The present invention relates to novel piperazinylbutylindoles, -indazoles, the corresponding 2,3-dihydro derivatives and 2-indolones which have been found to have central serotonin activity with preference for the serotonin 5-HT<sub>1A</sub> receptor.

Compared to the anxiolytic drug buspirone, and other clinically investigated compounds such as ipsapirone and gepirone, most of the present compounds have lower efficacy at the 5-HT<sub>1A</sub> receptor which implies fewer side effects related to activation of the receptors.

The invention also includes acid addition salts, methods of preparation, pharmaceutical compositions and method of treating CNS disorders occurring in anxiety, depression, aggression and in alcohol abuse, or in states of disease related to the cardiovascular, gastrointestinal and renal systems, by administering the aforementioned derivatives.

Separation and use of the stereo isomers of the 2,3-dihydro derivatives and 2-indolones are also part of this invention.

The novel indoles, indazoles, 2-indolones, and the 2,3-dihydro derivatives thereof are all represented by the following formula I:

$$R^{1}$$
 $(CH_{2})_{4}$ 
 $N$ 
 $N$ 
 $N$ 
 $R^{2}$ 

wherein the dotted line indicates an optional bond;

X is CH,  $CH_2$ , N(H) or C = O;

R¹ is hydrogen, halogen, lower alkyl, lower alkenyl, trifluoromethyl, (lower alkyl means 1-6 carbon atoms, branched or unbranched);

R<sup>2</sup> is hydrogen, lower alkyl or alkenyl (up to 6 carbon atoms inclusive, branched or unbranched) optionally substituted with one or two hydroxy groups, any hydroxy group present being optionally esterified with an aliphatic carboxylic acid having from two to twenty-four carbon atoms inclusive, or any of the following acyl groups

in which R³ and R⁴ are hydrogen, alkyl (1-20 C-atoms), branched or unbranched, cyclo alkyl (3-6 C-atoms), adamantyl, aralkyl (4-13 C-atoms inclusive);

Ar is

$$_{\text{YR}^{\text{5}}}$$
 or  $_{\text{YR}^{\text{5}}}$   $_{\text{R}^{6}}$   $_{\text{(CH}_{2})_{n}}$ 

in which Y is O or S; Z is O, S or CH<sub>2</sub>; n is 1, 2 or 3; and R<sup>5</sup> is hydrogen, lower alkyl or alkenyl (up to 6 carbon atoms inclusive, branched or unbranched); and R<sup>6</sup> is hydrogen or a group Y'R<sup>5</sup>, wherein Y' is O, S or CH<sub>2</sub> and R<sup>5</sup> is hydrogen, lower alkyl or alkenyl (up to 6 carbon atoms);

as well as pharmaceutically acceptable acid addition salts and stereo isomers thereof, with the proviso that Ar cannot be 2-methoxyphenyl when both R¹ and R² are hydrogen, X is CH and the dotted line represents a bond

4-Phenyl-1-piperazinylalkyl-3-indoles have previously been disclosed in the following patents: Fr. No. 1,551082 (Sterling Drug Inc. - 1968); U.S. No. 3,135,794 (Sterling Drug Inc. - 1964); GB No. 944,443 (Sterling Drug Inc. - 1963) and in the following papers as well: Med. Pharm. Chem. <u>5</u>, 932-943 (1962), Arch. Intern. Pharmacodyn. 157 (1) 67-89 (1965).

These patents and papers have focused on 4-phenyl-1-Piperazinylethyl-3-indoles with antihistaminergic, sedative, hypotensive and tranquillizing activity, however, without mentioning of serotonergic activity and the diseases where deficits in this neurotransmitter system are involved. The only butyl derivative included in our invention specifically mentioned in the above patents and papers was 3-[1-(2-methoxyphenyl)-4-piperazinyl]-4-butylindole (Compound 2a).

Accordingly, the present invention also relates to the use of compound <u>2a</u> and pharmaceutically acceptable acid addition salts thereof for the manufacture of a medicament having serotonergic activity.

Central serotoninergic activity has been reported for certain 1-(2-quinolyl)-4-(indolyl-3-alkyl)piperazines, Chemical Abstracts, 95 (1981) No. 1, 7218.

In the compounds of formula I the preferred compounds are dihydroindoles, 2-indolones and indazoles with R<sup>2</sup> being preferably hydrogen or methyl and R<sup>1</sup> hydrogen, halogen or trifluoromethyl. The aromatic substituent Ar is preferably 2-lower alkoxyphenyl, 1,4-benzodioxan-5-yl or 2,3-dihydro-7-benzofuranyl.

This invention also includes pharmaceutically acceptable salts of the compounds of Formula I formed with non-toxic organic or inorganic acids. Such salts are easily prepared by methods known to the art. The base is reacted with either the calculated amount of organic or inorganic acid in an aqueous miscible solvent, such as acetone or ethanol, with isolation of the salt by concentration and cooling or an excess of the acid in aqueous immiscible solvent, such as ethyl ether or chloroform, with the desired salt separating directly. Exemplary of such organic salts are those with maleic, fumaric, benzoic, ascorbic, embonic, succinic, oxalic, bis methylene-salicylic, methanesulfonic, ethanedisulfonic, acetic, propionic, tartaric, salicylic, citric, glucomic, lactic, malic, mandelic, cinnamic, citraconic, aspartic, stearic, palmitic, itaconic, glycolic, p-amino-benzoic, glutamic, benzene sulfonic, and theophylline acetic acids as well as the 8-halotheophyllines, for example 8-bromo-theophylline. Exemplary of such inorganic salts are those with hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric and nitric acids. Of course, these salts may also be prepared by the classical method of double decomposition of appropriate salts, which is well-known to the art.

According to the method of the invention, the compounds of Formula I are prepared by a) reducing the amide carbonyl of a compound of the formula II

$$\begin{array}{c|c}
O \\
\parallel \\
N - Ar
\end{array}$$

$$\begin{array}{c|c}
N - Ar
\end{array}$$

$$\begin{array}{c|c}

whereupon the compound of Formula I formed is isolated as the free base, or a pharmaceutically acceptable acid addition salt thereof, and if desired, separated in individual optical isomers.

The reduction according to method a) may preferably be carried out in an inert organic solvent such as diethyl ether or tetrahydrofuran in the presence of lithium aluminium hydride at reflux temperature.

Reduction of the 2-3 double bond of indoles or indazoles according to method d) is conveniently performed by catalytic hydrogenation in an alcohol with platinum or by hydroboration with diborane or a diborane precursor such as the trimethylamine or dimethylsulphide complex in tetrahydrofuran or dioxane from 0 ° C to reflux temperature, followed by acid catalyzed hydrolysis of the intermediate borane derivative.

Alkylation of an arylpiperazine according to method c) is conveniently performed in an inert organic solvent such as a suitably boiling alcohol or ketone, preferably in the presence of a base (potassium carbonate or triethylamine) at reflux temperature.

1-Arylpiperazines are either commercially available or may be prepared according to the methods in Martin et al. J.Med.Chem., 32 1052-1056 (1989).

3-Indolebutyric acids are convenient starting materials for the preparation of indolebutyric acid amides (formula II, X = CH) and for alkylating indolebutyl derivatives (formula IV, X = CH). The butyric acids are prepared according to DE 3421,641 A1 or HUN.PAT. No. 187 127.

The carboxylic acids are further reacted according to the following reaction scheme:

5

$$R^1$$
 $R^2$ 
 $(CH_2)_3COOH$ 

method g)

 $R^1$ 
 $R^2$ 
 $(CH_2)_4OH$ 
 $R^1$ 
 $R^2$ 
 $(CH_2)_4OH$ 
 $R^2$ 
 $R^3$ 
 $R^2$ 
 $(CH_2)_4OH$ 
 $R^3$ 
 $R^3$ 

Hydrazones of the general formula VIII are conveniently obtained according to the following reaction procedure:

15 
$$O$$
 $C(CH_2)_4$   $N$ 
 $N-Ar$ 
 $MHR^2$ 
 $C(CH_2)_4$   $N$ 
 $N-Ar$ 
 $N-A$ 
 $N-A$ 

The methods of the invention shall in the following be illustrated by some examples

## EXAMPLE 1

10

25

45

50

55

### 30 Methods i) and a)

5-Fluoro-3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-indole, 1a

To a solution of 5-fluoro-3-(3-carboxypropyl)-1H-indole (11 g) in 200 ml of dry THF was added 1-(2-methoxyphenyl)piperazine (9.6 g) and subsequently N,N-dicyclohexyl carbodiimide (12.5 g) and 4-(N,N-dimethylamino)pyridine (0.5 g). The mixture was stirred overnight, filtered and the solvent evaporated in vacuo. The remaining oil was dissolved in ethyl acetate (200 ml) and washed with brine (2 x 100 ml), the organic phase was dried (MgSO<sub>4</sub>), filtered and finally evaporated leaving 19 g of a viscous oil. The product was eluted through silica gel (900 g) with ethyl acetate yielding 9.8 g of the carboxylic acid amide as an oil. The amide (9.8 g) in dry THF (100 ml) was added dropwise to a suspension of LiAlH<sub>4</sub> (5 g) in dry THF (80 ml). The mixture was refluxed for 2 hours. After cooling in an ice bath, THF containing 10% of water was added dropwise with stirring. Solid NH<sub>4</sub>Cl (25 g) was added, and the precipitated inorganic salts were filtered off. The solvents were evaporated and the remaining water was removed by evaporation twice with toluene. The residue (9.2 g) was dissolved in isopropyl ether. The title compound crystallized by refrigeration. Yield: 7.4 g. MP 98-100 °C.

In a similar manner was also prepared: 6-Chloro-3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-indole, 1b. MP 135-138 °C.

## **EXAMPLE 2**

# Methods g) and c)

3-[4[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-indole, 2a

A solution of 3-(3-carboxypropyl)-1H-indote (20 g) in diethyl ether (300 ml) was added dropwise to a suspension of LiAlH4 (12 g) in diethyl ether (200 ml). The reaction mixture was refluxed for 2 hours and cooled to 10 °C. The mixture was hydrolyzed by careful addition of water and was finally filtered. The filter cake was thoroughly washed with THF. Evaporation of the solvents yielded 17 g of the crude butanol

derivative.

To a solution of the butanol (8 g) in dichloromethane (200 ml) was added triethylamine (9 ml). After cooling to 5 °C methanesulfonylchloride (4.5 ml) in dichloromethane (35 ml) was added dropwise at 5-10 °C. Stirring was continued for another  $\frac{1}{2}$  hour. The mixture was dissolved in ethyl acetate / dichloromethane (1:1) and filtered through silica gel. The solvents were evaporated affording 9 g of the methansulfonic acid ester.

To a solution of the ester (8 g) in dry acetone (100 ml) were added 1-(2-methoxyphenyl)piperazine (5.5 g) and  $K_2CO_3$  (6 g anh.). The mixture was refluxed for 24 hours. The acetone was evaporated and the residue dissolved in diethylether and water. The water phase was made acidic by addition of acetic acid, and the organic phase was separated and discarded. The water phase was made alkaline (pH = 10) by addition of NH<sub>4</sub>OH. Extraction with ethyl acetate (2 x 100 ml) and subsequent working up of the combined organic phases yielded 10 g of crude product.

The pure title compound 2a crystallized from diethyl ether. MP: 113-115 °C.

In a similar manner were also prepared:

3-[4-[4-(2,3-dihydro-7-benzofuranyl)-1-piperazinyl]-1-butyl]-1H-indole, 2b. MP: 136-138 °C.

3-[4-[4-(1,4-benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-1H-indole, oxalate 2c. MP: 174-177 °C.

3-[4-[4-(1,4-benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-5-fluoro-1H-indole, oxalate 2d. MP: 188 ° C.

3-[4-[4-(2,3-dihydro-7-benzofuranyl)-1-piperazinyl]-1-butyl]-5-fluoro-1H-indole, 2e, MP: 102-103 °C.

### **EXAMPLE 3**

20

### Method d)

3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, dioxalate, 3a.

Compound 2a (10 g) and borane / trimethylamine complex (24 g) were dissolved in dioxan (160 ml). Conc. hydrochloric acid (18 ml) was added at 25-30 °C during 30 min. The mixture was then slowly heated to reflux temperature and refluxed for 1 hour. After cooling to room temperature 6 M hydrochloric acid (60 ml) was added, and the mixture was further refluxed for 1/2 h. After cooling diethyl ether (200 ml) and dil. NaOH solution (200 ml) were added. The organic phase was separated. The basic product was extracted into 0.2 M methanesulfonic acid solution. The acidic water phase was made alkaline (NH<sub>4</sub>OH) and the product was extracted with diethyl ether. The organic phase was evaporated, dried (MgSO<sub>4</sub>) and filtered. Finally the ether was evaporated.

The title compound 3a crystallized as a dioxalate salt from a boiling ethanol/acetone mixture by addition of oxalic acid. Yield: 11.2 g (75%). MP: 169-170 °C.

In a similar manner were also prepared:

3-[4-[4-(2-methylthiophenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, dioxalate, 3b, MP: 152 °C.

3-[4-[4-(2-ethoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, dioxalate 3c, MP: 93-94 °C.

3-[4-[4-(2-isopropyloxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, dioxalate, 3d, MP: 176-177 °C.

5-chloro-3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, oxalate, <u>3e</u>, MP: 137-

6-chloro-3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, trihydrochloride hydrate, 3f, MP: 168-172 °C.

5-fluoro-3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, 3g, MP: 70-73 °C.

3-[4-[4-(2,3-dimethoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, 3h, MP: 111-112 °C.

3-[4-[4-(2,3-dihydro-7-benzofuranyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, dioxalate, 3i, MP: 81-83 °C.

3-[4-[4-(1,4-benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, dioxalate, 3j, MP: 168-169 °C.

3-[4-[4-(1,4-benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-5-chloro-1H-2,3-dihydroindole, oxalate, 3k, MP: 143 ° C.

3-[4-[4-(1,4-benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-5-fluoro-1H-2,3-dihydroindole, dioxalate, 3I, MP:

3-[4-[4-(2,3-dihydro-7-benzofuranyl)-1-piperazinyl]-1-butyl]-5-fluoro-1H-2,3-dihydroindole 3m, MP: 59 °C.

### **EXAMPLE 4**

3-[4-[4-(2-hydroxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, 4a

55

A mixture of 4 g of Compound 3a and 40 g of pyridine hydrochloride was heated to 190-200 °C under a nitrogen atmosphere for 1.5 hours. After cooling to room temperature dil. NH<sub>4</sub>OH and ethyl acetate were added. The organic phase was separated, dried (MgSO<sub>4</sub>), filtered, and ethyl acetate evaporated. The

remaining oil crystallized from isopropyl ether, yielding 2.1 g of the title compound 4a. MP: 87-88 ° C.

### **EXAMPLE 5**

### Method b)

1-Acetyl-3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, oxalate, 5a.

To a solution of compound 3a (3 g) and triethylamine in dichloromethane (50 ml) was added acetylchloride (1 ml) in dichloromethane (10 ml) at room temperature during 10 minutes. After stirring for 2 hours the mixture was poured into dil. NH<sub>4</sub> OH. The dichloromethane phase was separated, dried (MgSO<sub>4</sub>), filtered and evaporated. Column chromatography on silica gel (eluted with 4% triethylamine in ethyl acetate) yielded 2.5 g of an oil.

The title compound 5a was isolated as an oxalate salt, MP: 115-117 °C.

### **EXAMPLE 6**

### Method b)

15

35

3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1-methyl-1H-2,3-dihydroindole, oxalate, 6a.

Compound 3a (7 g), triethylamine (8 ml) and ethyl chloroformate (5 ml) were mixed in ice cooled dichloromethane (100 ml). After refluxing for 5 hours the reaction mixture was washed with 0.5 M NH<sub>4</sub>OH solution (2 x 50 ml), the organic phase was separated, dried (MgSO<sub>4</sub>) and the solvent evaporated yielding 8 g of crude carbamate.

The crude product in dry diethyl ether (100 ml) was added dropwise to an ice cooled suspension of LiAlH<sub>4</sub> in dry diethyl ether (200 ml). After 2 hours of reflux the mixture was carefully hydrolysed. The solid material was filtered off and washed with dichloromethane. The combined organic phases were dried (MgSO<sub>4</sub>) and the solvents were evaporated affording 6.2 g of the title compound as an oil. The oxalate salt 6a was precipitated in acetone. MP: 117-120 °C.

## **EXAMPLE 7**

Resolution of Compound 3a

(+)-3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole,  $\overline{7}$ a (-)-3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole,  $\overline{7}$ b

Compound 3a (55 g) was dissolved in acetone (600 ml). At reflux temperature was added (+)-0,0-dibenzoyl tartaric acid (85 g). The mixture was allowed to cool and left at room temperature for 4 hours. The precipitated salt was filtered off. Yield: 53 g (Frakt.I). The remaining solution was evaporated and, subsequently, dil. NH<sub>4</sub> OH and diethyl ether were added. The organic phase was separated, dried (MgSO<sub>4</sub>), filtered, and the ether evaporated. To 14 g of the remaining oil was added (-)-0,0-dibenzoyl tartaric acid (21 g) in refluxing acetone (200 ml). The mixture was allowed to cool and left at room temperature for 4 hours. The precipitated salt was filtered off. Yield: 20 g (Frakt.II).

<u>Frakt.</u>! (31 g) was dissolved in boiling acetone (300 ml). After cooling and stirring for 3 hours at room temperature the precipitated salt was filtered off. Yield: 20 g. MP: 98 °C. The thus obtained salt was added to a mixture of dil. NH<sub>4</sub>OH and diethyl ether. The organic phase was separated, dried (MgSO<sub>4</sub>) and the ether evaporated leaving 10 g of an oil. The oil was dissolved in acetone (50 ml), and oxalic acid (3.5 g) was added. The crystalline precipitate was filtered off and dried. Yield: 8.1 g [ $\alpha$ ]<sub>D</sub> = +7,39 ° (c = 1, methanol). The oxalate salt was added to dil. NH<sub>4</sub>OH and diethyl ether. The organic phase was separated, dried (MgSO<sub>4</sub>), filtered, and the solvent evaporated. The remaining oil was dissolved in cyclohexane and left over night in a refrigerator. The precipitated crystalline product was filtered off, yielding 2.5 g of the title (+)-isomer, 7a. MP: 68 °C. [ $\alpha$ ]<sub>D</sub> = +41,50 ° (c = 1, methanol).

Similarly the (-)-isomer, 7b, was obtained from Frak.ll . Yield: 1.6 g. MP: 68 °C. [ $\alpha$ ]<sub>D</sub> = -39,27 ° (c = 1, methanol).

In a similar way Compound <u>3i</u> was resolved: (+)-3-[4-[4-(1,4-benzodioxan-5-yi]-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, dioxalate, 7c, MP: 169 °C.

 $[\alpha]_D = +1.93$ ° (c = 1, water). (-)-3-[4-[4-(1,4-benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole, dioxalate,  $\overline{7d}$ , MP: 169 °C.  $[\alpha]_D = 2.02$ ° (c = 1, water).

### EXAMPLE 8

10

30

Methods g), h) and e)

3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindol-2-on, dihydrochloride. 8a

To 3-indolyl-4-butan-1-ol (prepared as in Example 2) (14 g) in 95% tert.-butanol (500 ml) was added N-bromosuccinamide (16 g) during 1.5 h in small portions at room temperature. After stirring for another ½ hour 200 ml of ethanol and 20 ml of water were added. The mixture was stirred with NaBH<sub>4</sub> (4 g) for 1.5 h. The organic solvents were evaporated and the 2-indolonbutanol was extracted with ethyl acetate. The organic phase was dried (MgSO<sub>4</sub>), and the solvent subsequently evaporated yielding 11 g of crude product. The pure compound crystallized from isopropylether. MP: 82 ° C.

To the 2-indolon derivative (5 g) from above was added triethylamine (5 ml) in dichloromethane (100 ml). The mixture was cooled to 5 °C, and methanesulfonylchlorid (2.5 ml) in dichloromethane (25 ml) was added dropwise during 20 minutes. The mixture was stirred for another hour at room temperature. Water (200 ml) was added and the organic phase was separated, dried (MgSO<sub>4</sub>), and the dichloromethane was evaporated yielding 7 g of an oil.

To this oil in acetone (150 ml) were added 1-(2-methoxyphenyl)piperazine (7 g) and  $K_2 CO_3$  (5 g). The mixture was refluxed for 17 h. The precipitated inorganic salts were filtered off and the acetone was subsequently evaporated leaving 3 g of crude title compound. The dihydrochloride salt  $\underline{8a}$  was precipitated from acetone. Yield: 1.9 g. MP: 181-184 °C.

## **EXAMPLE 9**

Methods c) and f)

3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-5-trifluoromethyl-1H-indazole, oxalate . 9a

To a suspension of Mg-turnings (27 g) in dry tetrahydrofuran (100 ml) covered with N<sub>2</sub> was added ethylbromide (28 g) in dry tetrahydrofuran (100 ml) during 45 minutes at reflux temperature. After stirring for another ½ hour, 4-chloro-1-butanol (44 g) in dry tetrahydrofuran (100 ml) was added during 1 hour at reflux temperature. After stirring for another ½ hour the reaction mixture was cautiously added to a solution of 2-chloro-5-trifluoromethylbenzonitrile (40 g) in dry tetrahydrofuran (150 ml). The temperature was kept below 35 °C. After stirring for 1 hour the reaction mixture was poured onto ice (500 g) and conc. HCI (100 ml). Ether (200 ml) was added, and the mixture was vigorously stirred and then slowly allowed to reach room temperature. The organic phase was finally separated, dried (MgSO<sub>4</sub>), and the solvents evaporated leaving 44 g of an oil which was purified by column chromatography (eluted with dichloromethane/ether 3:1). Yield: 11 g of 4-(2-chloro-5-trifluoromethylphenyl)-4-oxo-pentan-1-ol.

The pentanol derivative (11 g) was dissolved in dichloromethane (100 ml) containing triethylamine (8ml). After cooling of the mixture (10 °C) methanesulphonyl chloride (4 ml) dissolved in dichloromethane (20 ml) was added dropwise during  $\frac{1}{2}$  hour. Upon another  $\frac{1}{2}$  h of stirring, water (300 ml) was added, and the organic phase subsequently separated. After drying (MgSO<sub>4</sub>), filtering and evaporation of the organic solvents 14 g of 4-(2-chloro-5-trifluoromethylphenyl)-4-oxo-1-pentyl methanesulphonate were isolated.

To the methansulphonic acid ester (14 g) in acetone (200 ml) were added 1-(2-methoxyphenyl)piperazine (12 g) and  $K_2CO_3$  (6 g). This mixture was heated at reflux temperature for 24 hours. Inorganic salts were filtered off and the acetone evaporated. The resulting oil was purified by elution (ethyl acetate / n-heptane /triethylamine 60:40:4) through silica gel. 17 g of 1-[4-(2-chloro-5-trifluoromethylphenyl)-4-oxo-1-phenyl]-4-(2-methoxyphenyl)piperazine was thus isolated as an oil.

To this piperazinyl derivative (9 g) in ethanol (100 ml) was added hydrazine hydrate (20 ml). The mixture was refluxed for 5 h. After evaporation the remaining oil was purified by column chromatography on silica gel leaving 9 g of a reasonably pure hydrazone derivative, which was dissolved in DMF (70 ml). Potassium t-butoxide (5 g) was added by portions during  $\frac{1}{2}$  h. After heating at 50 °C for 2 h, ether (200 ml) and saturated NH<sub>4</sub>Cl solution (200 ml) were added. The organic phase was separated, dried (MgSO<sub>4</sub>), filtered, and the organic solvent evaporated.

The remaining oil was purified by column chromatography (eluted with 4% triethylamine in ethyl acetate) on silica gel, yielding 3.4 g of the title compound <u>9a</u> as an oil. An oxalate salt crystallized from acetone. MP: 163-165 °C.

Some of the compounds of Formula I have been tested according to established and reliable pharmacological tests as follows:

### INHIBITION OF 3H-8-OHDPAT BINDING TO SEROTONIN 5-HT1A RECEPTORS IN RAT BRAIN IN VITRO

By this method the inhibition by drugs of the binding of <sup>3</sup>H-8-OHDPAT (1 nM) to serotonin 5-HT<sub>1A</sub> receptors in membranes from rat brain minus cerebellum is determined in vitro.

### **Procedure**

Male Wistar (Mol:Wist) rats (125-250 g) are sacrificed and the brain is dissected and weighed. The brain tissue minus cerebellum is homogenized (Ultra Turrax, 20 sec) in 10 ml of ice cold 50 mM Tris buffer pH 8.0 (at 25 °C) containing 120 mM NaCl, 4 mM CaCl<sub>2</sub> and 4 mM MgCl<sub>2</sub>. The homogenate is centrifuged at 20,000 g for 10 min at 4 °C. The pellet is homogenized in 10 ml of buffer and incubated at 37 °C for 10 min. The homogenate is centrifuged as above and the pellet is homogenized in 100 vol (w/v) icecold buffer containing 10 μ M of pargyline.

Incubation tubes kept on ice in triplicate receive 100  $\mu$  I of drug solution in water (or water for total binding) and 1000  $\mu$  I of tissue suspension (final tissue content corresponds to 10 mg original tissue). The binding experiment is initiated by addition of 100  $\mu$  I of <sup>3</sup>H-8-OHDPAT (final concentration 1 nM) and by placing the tubes in a 37 °C water bath. After incubation for 15min the samples are filtered under vacuum (0-50 mBar) through Whatman GF/F filters (25 mm). The tubes are rinsed with 5 mI ice cold 0.9% NaCl which are then poured on the filters. Thereafter, the filters are washed with 2 x 5 mI 0.9% NaCl. The filters are placed in counting vials and 4 mI of appropriate scintillation fluid (e.g.Picofluor M 15) are added. After shaking for 1 h and storage 2 h in the dark the content of radioactivity is determined by liquid scintillation counting. Specific binding is obtained by subtracting the nonspecific binding in the presence of 10  $\mu$  M of 5-HT.

For determination of the inhibition of binding five concentrations of drugs covering 3 decades are used. The measured cpm are plotted against drug concentration on semilogarithmic paper, and the best fitting s-shaped curve is drawn. The IC<sub>50</sub>-value is determined as the concentration, at which the binding is 50% of the total binding in control samples minus the nonspecific binding in the presence of 10  $\mu$  M of 5-HT. <sup>3</sup>H-8-OHDPAT from Amersham International plc. England. Specific activity approximately 200 Ci/mmol).

# INHIBITION OF 5-METHOXY-N,N-DIMETHYLTRYPTAMINE INDUCED 5-HT SYNDROME IN RATS

The so-called 5-HT syndrome is a characteristic behaviour pattern which is induced by 5-HT agonists with effects on 5-HT, possibly 5-HT<sub>1A</sub> receptors, although lack of specific antagonists make it difficult to evaluate specificity (Smith, L.M. and S.J. Peroutka, Pharmacol.Biochem. & Behaviour <u>24</u>, 1513-1519, 1986; Tricklebank, M. et al., Eur.J.Pharmacol. 117, 15-24, 1985).

### **Procedure**

Male Wistar rats (Mol:Wist) weighing 170-240 g are used. Test substance is injected subcutaneously 30 min. before 5-methoxy-N,N-dimethyltryptamine 5 mg/kg, s.c. Four rats are used for each dose. A control group pretreated with saline is included each test day. Ten, 15 and 20 min later the rats are observed for presence of serotonin (5-HT) syndrome: 1) forepaw treading ("piano playing"), 2) head weaving and 3) hindleg abduction. Further, flat motility is scored. Each part of the syndrome is scored as follows: marked effect (score 2), weak syndrome (score 1) and no effect (score 0). The scores of the three observation times are added. Thus the maximum obtainable score for four rats is 24. The effect of the test substance is expressed as per cent inhibition relative to the control group.

The per cent inhibition of the piano playing syndrome is used as the response, and ED<sub>50</sub> values are calculated by log-probit analysis.

30

#### ANTAGONISM OF THE DISCRIMINATIVE STIMULUS PROPERTIES INDUCED BY 8-OHDPAT IN RATS.

This test model is used to determine the antagonist effects of a test compound on 5-HT<sub>1A</sub> receptors in vivo. A related method is described by Tricklebank, M.D., J. Neill, E.J. Kidd and J.R. Fozard, Eur.J.Pharmacol. 133, 47-56, 1987; Arnt, J., Pharmacology & Toxicology 64, 165-172, 1989.

### **Procedure**

Male Wistar rats are trained to discriminate between 8-OHDPAT (0.4 mg/kg, i.p., 15 min. pretreatment) and physiological saline in operant chambers equipped with two response levers. Between the levers a dipper is placed, where water rewards (0.1 ml) are presented. The rats are water deprived for at least 24 h and work in a fixed ratio (FR) schedule (final FR = 32).

Following 8-OHDPAT administration responding is reinforced only on a designated (drug) lever, whereas responding on the opposite lever has no consequences. Following saline administration responding is reinforced on the lever opposite to the drug lever. Drug and saline trials alternate randomly between training days, although the same treatment is given maximally at 3 consecutive days. The level of discrimination occuracy is expressed as the per cent drug responses and is calculated as the number of correct responses x 100 divided by the sum of the correct and incorrect responses before the first reward. When stable occuracy (mean correct responding = 90 per cent; individual rats at least 75 per cent correct responding) is obtained test sessions are included between training days. Test compound is injected s.c. at appropriate time before 8-OHDPAT and the test begins 15 min after 8-OHDPAT injection. The test trial is terminated when a total of 32 responses are made on either lever or when 20 min have elapsed. No reward is given and the rats have free access to water for 20-30 min after the test. The effects are expressed as per cent inhibition of drug responding. Only results from rats making at least 10 responses on one lever are included in data analysis. Furthermore, only test sessions in which at least half of the rats respond are included

The per cent inhibition of drug response obtained for each dose of test compound is used to calculate ED<sub>50</sub> values by log-probit analysis.

# GENERALIZATION TO DISCRIMINATIVE STIMULUS PROPERTIES INDUCED BY 8-OHDPAT IN RATS.

This test model is used to determine the agonist effects of a test compound on 5-HT<sub>1A</sub> receptors in vivo. A related method is described by Tricklebank, M.D., J. Neill, E.J. Kidd and J.R. Fozard, Eur.J.Pharmacol. 133, 47-56, 1987; Arnt, J., Pharmacology & Toxicology 64, 165-172, 1989.

### **Procedure**

35

The procedure is the same as for the antagonism test mentioned above, except that the test compound is substituted for 8-OHDPAT and injected s.c. usually 30 minutes or 45 minutes respectively before beginning of the test.

The per cent drug response obtained for each dose of test compound is used to calculate ED<sub>50</sub> values by log-probit analysis.

55

50

The results obtained will appear from the following tables 1 and 2:

# Table I

The compounds of Formula I and the non-toxic acid addition salts thereof may be administered to animals such as dogs, cats, horses, sheep or the like, including human beings, both orally and parenterally, and may be used, for example, in the form of tablets, capsules, powders, syrups or in the form of the usual sterile solutions for injection.

Most conveniently the compounds of Formula I are administered orally in unit dosage form such as tablets or capsules, each dosage unit containing the free amine or a non-toxic acid addition salt of one of the said compounds in a amount of from about 0.10 to about 100 mg, most preferably, however, from about 5 to 50 mg, calculated as the free amine, the total daily dosage usually ranging from about 1.0 to about 500 mg. The exact individual dosages as well as daily dosages in a particular case will, of course, be determined according to established medical principles under the direction of a physician.

When preparing tablets, the active ingredient is for the most part mixed with ordinary tablet adjuvants such as corn starch, potato starch, talcum, magnesium stearate, gelatine, lactose, gums, or the like.

Typical examples of formulas for composition containing 3-[4[4-(1,4-benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole (Compound No. 3j) as the active ingredient, are as follows:

1) Tablets containing 5 milligrams of Compound No. 3j calculated as the free base:

Compound No. 3j	5 mg
Lactose	18 mg
Potato starch	27 mg
Saccharose	58 mg
Sorbitol	3 mg
Talcum	5 mg
Gelatine	2 mg
Povidone	1 mg
Magnesium stearate	0.5 mg

2) Tablets containing 50 milligrams of Compound No. 3j calculated as the free base:

Compound No. 3j Lactose Potato starch Saccharose	50 mg 16 mg 45 mg 106 mg
	-
Sorbitol	6 mg
Talcum	9 mg
Gelatine	4 mg
Povidone	3 mg
Magnesium stearate	0.6 mg

3) Syrup containing per milliliter:

5

20

25

30

35

40

45

Compound No. 3j 10 ma 500 mg Sorbitol Tragacanth 7 mg Glycerol 50 mg Methyl-paraben 1 mg Propyl-paraben 0.1 mg Ethanol 0.005 ml Water ad 1 ml

4) Solution for injection containing per milliliter:

Compound No. 3j 50 mg
Acetic acid 17.9 mg
Sterile water ad 1 ml

5) Solution for injection containing per milliliter:

Compound No. 3j	10 mg
Sorbitol	42.9 mg
Acetic acid	0.63 mg
Sodium hydroxide	22 mg
Sterile water	ad 1 ml

Any other pharmaceutical tableting adjuvants may be used provided that they are compatible with the active ingredient, and additional compositions and dosage forms may be similar to those presently used for neuroleptics, analgesics or antidepressants..

Also combinations of the compounds of Formula I as well as their non-toxic acid salts with other active ingredients, especially other neuroleptics, thymoleptics, tranquilizers, analgetics or the like, fall within the scope of the present invention.

As previously stated, when isolating the compounds of Formula I in the form of an acid addition salt the acid is preferably selected so as to contain an anion which is non-toxic and pharmacologically acceptable, at least in usual therapeutic doses. Representative salts which are included in this preferred group are the hydrochlorides, hydrobromides, sulphates, acetates, phosphates, nitrates, methanesulphonates, ethanesulphonates, lactates, citrates, tartrates or bitartrates, pamoates and maleates of the amines of Formula I. Other acids are likewise suitable and may be employed if desired. For example: fumaric, benzoic, ascorbic, succinic, salicylic, bismethylenesalicylic, propionic, gluconic, malic, malonic, mandelic, cinnamic, citraconic, stearic, palmitic, itaconic, glycolic, benzenesulphonic, and sulphamic acids may also be employed as acid addition saltforming acids.

When it is desired to isolate a compound of the invention in the form of the free base, this may be done according to conventional procedure as by dissolving the isolated or unisolated salt in water, treating with a suitable alkaline material, extracting the liberated free base with a suitable organic solvent drying the extract and evaporating to dryness or fractionally distilling to effect isolation of the free basic amine.

The invention also comprises a method for the alleviation, palliation, mitigation or inhibition of the manifestations of certain physiological-psychological abnormalies of animals, involving the neurotransmitter serotonin, by administering to a living animal body, including human beings, an adequate quantity of a compound of Formula I or a non-toxic acid addition salt thereof. An adequate quantity would be from about 0.001 mg to about 10 mg per kg of body weight per day, and from about 0.003 milligrams to about 7 milligrams /kg of body weight per day.

### Claims for the following Contracting States: AT, BE, CH, DE, FR, GB, IT, LI, LU, NL, SE

### 1. A compound of the following formula:

wherein the dotted line indicates an optional bond;

X is CH,  $CH_2$ , N(H) or C = O;

R¹ is hydrogen, halogen, lower alkyl, lower alkenyl, trifluoromethyl, (lower alkyl means 1-6 carbon atoms, branched or unbranched);

R<sup>2</sup> is hydrogen, lower alkyl or alkenyl (up to 6 carbon atoms inclusive, branched or unbranched) optionally substituted with one or two hydroxy groups, any hydroxy group present being optionally esterified with an aliphatic carboxylic acid having from two to twenty-four carbon atoms inclusive, or any of the following acyl groups.

in which R³ and R⁴ are hydrogen, alkyl (1-20 C-atoms), branched or unbranched, cycloalkyl (3-6 C-atoms), adamantyl, aralkyl (4-13 C-atoms inclusive);

Ar is

$$\longrightarrow_{\mathsf{YR}^{\mathsf{S}}} \mathsf{R}^{\mathsf{G}} \qquad \mathsf{or} \qquad \longrightarrow_{\mathsf{(CH_2)}_0} \mathsf{CH_2)_0}$$

in which Y is O or S; Z is O, S or  $CH_2$ ; n is 1, 2 or 3; and  $R^5$  is hydrogen, lower alkyl or alkenyl (up to 6 carbon atoms inclusive, branched or unbranched); and  $R^6$  is hydrogen or a group Y' $R^{5'}$ , wherein Y' is O, S, or  $CH_2$  and  $R^{5'}$  is hydrogen, lower alkyl or alkenyl (up to 6 carbon atoms); as well as pharmaceutically acceptable acid addition salts and stereo isomers thereof, with the proviso that Ar cannot be 2-methoxyphenyl when both  $R^1$  and  $R^2$  are hydrogen, X is CH and the dotted line represents a bond.

2. A compound according to claim 1, wherein R¹ is hydrogen, halogen or trifluoromethyl, R² is hydrogen or methyl, Ar is 2-lower alkoxyphenyl, 1,4-benzodioxan-5-yl or 2,3-dihydro-7-benzofuranyl, and X is CH₂, C = O or N(H);

as well as pharmaceutically acceptable acid addition salts and stereo isomers thereof.

- A compound according to claim 1 or 2, selected from: 3-[4-[4-(1,4-benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-1H-2, 3-dihydroindole 3-[4-[4-(2,3-dihydro-7-benzofuranyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole -5-Chloro-3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole 3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole (+)-3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole as well as pharmaceutically acceptable acid addition salts thereof.
- 4. 3-[4-[4-(1,4-benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole; as well as pharmaceutically acceptable acid addition salts thereof.

5

10

20

30

35

55

3.

- 5. A pharmaceutical composition in unit dosage form comprising, as an active ingredient, a compound as defined in claim 1, 2, 3 or 4, and one or more pharmaceutical diluents or carriers.
- A pharmaceutical composition in unit dosage form according to claim 5, wherein the active ingredient is present in an amount from 0.1 to 100 milligrams per unit dosage.
- 7. The use of 3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-indole and pharmaceutically acceptable acid addition salts thereof for the manufacture of a medicament having serotonergic activity.
  - 8. A method for the preparation of a compound as defined in claim 1, which comprises a) reducing the amide carbonyl of a compound of the formula II

wherein R¹, R², X and Ar are as previously defined;
b) alkylating, acylating or arylating a compound of the formula III

45
$$R^{1} \xrightarrow{X} (CH_{2})_{4} N \longrightarrow N - Ar$$

$$III$$

with an alkyl-, acyl- or phenylhalogenide R<sup>2</sup>X. R<sup>1</sup>, X and Ar are as previously defined. Acylation of the NH group with a carboxylic acid chloride with subsequent reduction of the amide also gives compounds for structure I;

c) alkylating an arylpiperazin

5 with an alkylating reagent of the following formula IV

$$R^{1} = \begin{pmatrix} (CH_{2})_{4} - L \\ N \\ R^{2} \end{pmatrix}$$

wherein R1, R2 and X are as previously defined, while L is a leaving group as eg. halogen, mesylate or tosylate;

d)

10

20

25

30

55

reducing the 2-3 double bond in an indole or indazole derivative of the following formula V

wherein  $R^1$ ,  $R^2$ , X and Ar are as previously defined;

oxidizing an indole derivative of the formula VI to an 2-indolone derivative of formula VII

35
$$R^{1} \underbrace{ \left( CH_{2} \right)_{4} N \right)}_{N} N - Ar$$

$$OX$$

$$R^{1} \underbrace{ \left( CH_{2} \right)_{4} N \right)}_{R^{2}} N - Ar$$

$$\underbrace{ \left( CH_{2} \right)_{4} N \right)}_{N} N - Ar$$

$$\underbrace{ \left( CH_{2} \right)_{4} N \right)}_{N} N - Ar$$

$$\underbrace{ \left( CH_{2} \right)_{4} N \right)}_{N} N - Ar$$

f) making a ring closure reaction of the hydrazone VIII to the indazole derivative IX

45

$$R^{1} = \begin{bmatrix} CH_{2} & N & N-Ar \\ N & N & N-Ar \\ R^{2} & N & N-Ar \\ N & N & N & N & N-Ar \\ N & N & N & N & N-Ar \\ N & N & N & N-$$

whereupon the compound of Formula I formed is isolated as the free base, or a pharmaceutically acceptable acid addition salt thereof, and if desired, separated in individual optical isomers.

- 2. A method according to claim 1, wherein the compound has the formula I in which R¹ is hydrogen, halogen or trifluoromethyl, R² is hydrogen or methyl, Ar is 2-lower alkoxyphenyl, 1,4-benzodioxan-5-yl or 2,3-dihydro-7-benzofuranyl, and X is CH₂, C = O or N(H); as well as pharmaceutically acceptable acid addition salts and stereo isomers thereof.
- 3. A method according to claim 1, wherein the compound of formula I is selected from 3-[4-[4-(1,4-benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-1H-2, 3-dihydroindole 3-[4-[4-(2,3-dihydro-7-benzofuranyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole 5-Chloro-3-[4-(4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole 3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole (+)-3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole as well as pharmaceutically acceptable acid addition salts thereof.
- 4. A method according to claim 3, wherein the compound is 3-[4-[4-(1,4-benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindole; as well as pharmaceutically acceptable acid addition salts thereof.
- 45 5. The use of 3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-indole and pharmaceutically acceptable acid addition salts thereof for the manufacture of a medicament having serotonergic activity.

### Patentansprüche für folgende Vertragsstaaten: AT, BE, CH, DE, FR, GB, IT, LI, LU, NL, SE

## 1. Eine Verbindung der Formel:

 $R^{1}$   $(CH_{2})_{4}$  N N N  $R^{2}$ 

worin die punktierte Linie eine gegebenenfalls vorhandene Bindung anzeigt,

X die Bedeutung CH,  $CH_2$ , N(H) oder C = O hat;

R¹ Wasserstoff, Halogen, Niederalkyl, Niederalkenyl, Trifluormethyl ist (Niederalkyl bedeutet 1 bis 6 Kohlenstoffatome, verzweigt oder geradkettig).

R<sup>2</sup> Wasserstoff, Niederalkyl oder -alkenyl (bis 6 Kohlenstoffatome, verzweigt oder geradkettig) bedeutet, wobei letztere gegebenenfalls mit einer oder zwei Hydroxy-gruppen substituiert sind und jede vorhandene Hydroxygruppe gegebenenfalls mit einer aliphatischen Carbonsäure mit zwei bis 24 Kohlenstoffatomen einschließlich oder einer der folgenden Acylgruppen verestert sein kann:

wobei in der Acylgruppen R³ und R⁴ Wasserstoff, Alkyl (1-20 C-Atome) verzweigt oder geradkettig, Cycloalkyl (3-6 C-Atome), Adamantyl, Aralkyl (4-13 C-Atome einschließlich) Ar eine Gruppe

ist, in der Y O, S und Z O, S oder CH<sub>2</sub> ist, n gleich 1 2 oder 3 ist und R<sup>5</sup> Wasserstoff, Niederalkyl oder -alkenyl ist (bis zu 6 Kohlenstoffatome einschließlich, verzweigt oder geradkettig) und R<sup>5</sup> Wasserstoff oder eine Gruppe Y'R<sup>5</sup>', bedeutet, worin Y' O, S oder CH<sub>2</sub> ist und R<sup>5'</sup> Wasserstoff, Niederalkyl oder -alkenyl (bis zu 6 Kohlenstoffatome) bedeutet,

sowie pharmakologisch unbedenkliche Säureadditionssalze und Stereoisomere davon, mit der Maßgabe, daß Ar nicht 2-Methoxyphenyl ist, wenn sowohl R¹ wie R² Wasserstoff sind, X CH ist und die punktierte Linie eine Bindung darstellt.

Verbindung nach Anspruch 1, worin R¹ Wasserstoff Halogen oder Trifluoromethyl ist, R² Wasserstoff
oder Methyl ist, Ar 2-Niederalkoxyphenyl, 1,4-Benzodioxan-5-yl oder 2,3-Dihydro-7-benzofuranyl ist und
X CH₂, C = O oder N(H) ist; sowie pharmakologisch unbedenkliche Säureadditionssalze und Stereoisomere davon.

- 3. Verbindung nach Anspruch 1 oder 2, ausgewählt aus 3-{4-{4-(1,4-Benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-1H-2, 3-dihydroindol 3-{4-{4-(2,3-Dihydro-7-benzofuranyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindol -5-Chloro-3-{4-{4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]1H-2,3-dihydroindol 3-{4-{4-(2-Methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindol (+)-3-{4-{4-(2-Methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindol und deren pharmakologisch unbedenkliche Säureadditionssalze.
- 3-[4-[4-(1,4-Benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindol; sowie deren pharmakologisch unbedenkliche Säureadditionssalze.

- Pharmazeutische Zubereitung in Form von Dosierungseinheiten, enthaltend als aktiver Bestandteil eine Verbindung gemäß Anspruch 1, 2, 3 oder 4, und ein oder mehrere pharmazeutische Verdünnungsmittel oder Trägerstoffe.
- Pharmazeutische Zubereitung in Form von Dosierungseinheiten nach Anspruch 5, wobei der aktive Bestandteil in einer Menge von 0,1 bis 100 mg je Dosierungseinheit vorliegt.
- 20 7. Verwendung von 3-[4-[4-(2-Methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-indol und pharmakologisch unbedenkliche Säureadditionssalze davon zur Herstellung eines Arzneimittels mit serotonergischer Wirkung.
  - Verfahren zur Herstellung einer Verbindung gemäß Anspruch 1, umfassend
     a.) die Reduktion der Amid-carbonylgruppe einer Verbindung der Formel

$$R_1$$
 $(CH^5)^3C - N$ 
 $N - V$ 
 $R_5$ 
 $R_5$ 

in der R<sup>1</sup>, R<sup>2</sup>, X und Ar die vorstehende Bedeutung haben, b.) Alkylieren, Acylieren oder Arylieren einer Verbindung der Formel III

$$R^{1}$$
 $(CH_{2})_{4}$ 
 $N-A$ 

III

mit einem Alkyl-, Acyl- oder Phenylhalogenid R<sup>2</sup>X, worin R<sup>1</sup>, X und Ar die vorgenannte Bedeutung haben, Acylieren der NH-Gruppe mit einem Carbonsäurechlorid mit anschließender Reduktion der Amids, wobei Verbindungen der Struktur I ebenfalls erhalten werden,

c.) Alkylieren eines Arylpiperazins der Formel

mit einem Alkylierungsmittel der folgenden Formel IV:

$$R^{1} = \bigcup_{\substack{X \\ N \\ R^{2}}} (CH_{2})_{4} - L$$
IV

worin  $R^1$ ,  $R^2$  und X die vorgenannte Bedeutung haben, während L eine abspaltende Gruppe wie z.B. Halogen, Mesylat oder Tosylat ist,

d.) Reduktion der 2-3-Doppelbindung in einem Indol-oderIndazolderivat der folgenden Formel V:

in der R1, R2, X und Ar die vorgenannte Bedeutung haben,

e.) Oxydieren eines Indolderivats der Formel VI zu einem 2-Indolonderivat der Formel VII:

30 R1 
$$(CH_2)_4$$
 N N - Ar  $(CH_2)_4$  N N - Ar

f.) Durchführen einer Ringschlußreaktion des Hydrazons VIII zum Indazolderivat IX

40
$$R^{1} \longrightarrow C \longrightarrow (CH_{2})_{4} \longrightarrow N-A_{1}$$

- Verfahren nach Anspruch 1, wobei die Verbindung der Formel 1 ausgewählt ist aus 3-[4-[4-(1,4-Benzodioxan-5-yl)-1-piperazinyl]-1-butyl]-1H-2, 3-dihydroindol 3-[4-[4-(2,3-Dihydro-7-benzofuranyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindol -5-Chloro-3-[4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindol 3-[4-[4-(2-Methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindol (+)-3-[4-[4-(2-Methoxyphenyl)-1-piperazinyl]-1-butyl]-1H-2,3-dihydroindol und deren pharmakologisch unbedenkliche Säureadditionssalze.

## Revendications

15

25

45

Revendications pour les Etats contractants suivants : AT, BE, CH, DE, FR, GB, IT, LI, LU, NL, SE

1. Un composé de formule suivante :

dans laquelle le pointillé indique une double liaison facultative ; X est CH,  $CH_2$ , N(H) ou C=O ;

5

10

20

25

40

45

R¹ est un hydrogène, un halogène, un alkyle inférieur, un alcényle inférieur, un trifluorométhyle, (un alkyle inférieur étant défini comme ayant 1 à 6 atomes de carbone et étant ramifié ou non ramifié); R² est un hydrogène, un alkyle ou un alcényle inférieurs (jusqu'à 6 atomes de carbone inclusivement, ramifiés ou non ramifiés) facultativement substitués avec un ou deux groupes hydroxy, un groupe hydroxy quelconque présent étant facultativement estérifié avec un acide carboxylique aliphatique ayant de 2 à 24 atomes de carbone inclusivement, ou l'un quelconque des groupes acyles suivants :

dans lesquels R³ et R⁴ sont un hydrogène, un alkyle (1 à 20 atomes de carbone) ramifié ou non ramifié, un cycloalkyle (3 à 6 atomes de carbone), un adamantyle, un aralkyle (4 à 13 atomes de carbone inclusivement);

Ar est

où Y est O ou S; Z est O, S ou CH<sub>2</sub>; n est 1, 2 ou 3; R<sup>5</sup> est un hydrogène, un alkyle ou un alcényle inférieurs (jusqu'à 6 atomes de carbone inclusivement, ramifiés ou non ramifiés); et R<sup>6</sup> est un hydrogène ou un groupe Y'R<sup>5</sup>', où Y' est O, S ou CH<sub>2</sub> et R<sup>5'</sup> est un hydrogène, un alkyle ou un alcényle inférieurs (jusqu'à 6 atomes de carbone); ainsi que ses sels d'addition d'acides pharmaceutiquement acceptables et ses stéréo-isomères, sous réserve que Ar ne peut pas être un 2-méthoxyphényle lorsque R¹ et R² sont tous deux un hydrogène, X est CH et le pointillé représente une liaison.

- 2. Un composé selon la revendication 1 où R¹ est un hydrogène, un halogène ou un trifluorométhyle, R² est un hydrogène ou un méthyle, Ar est un 2-(alcoxy inférieur)phényle, un 1,4-benzodioxanne-5-yle ou un 2,3-dihydro-7-benzofurannyle, et X est CH₂, C = O ou N(H); ainsi que ses sels d'addition d'acides pharmaceutiquement acceptables et ses stéréo-isomères.
- 3. Un composé selon la revendication 1 ou 2, choisi parmi les suivants : 3-[4-[4-(1,4-benzodioxanne-5-yl)-1-pipérazinyl)-1-butyl]-1H-2,3-dihydro-indole 3-[4-[4-(2,3-dihydro-7-benzofurannyl)-1-pipérazinyl]-1-butyl]-1H-2,3-dihydro-indole 5-chloro-3-[4-[4-(2-méthoxyphényl)-1-pipérazinyl]-1-butyl]-1H-2,3-dihydro-indole 3-[4-[4-(2-méthoxyphényl)-1-pipérazinyl]-1-butyl]-1H-2,3-dihydro-indole (+)-3-[4-[4-(2-méthoxyphényl)-1-pipérazinyl]-1-butyl]-1H-2,3-dihydro-indole ainsi que leurs sels d'addition d'acides pharmaceutiquement acceptables.

4. 3-[4-[4-(1,4-benzodioxanne-5-yl)-1-pipérazinyl]-1-butyl]-1H-2,3-dihydro-indole, ainsi que ses sels d'addition d'acides pharmaceutiquement acceptables.

5. Composition pharmaceutique sous forme d'une dose unitaire d'administration, comprenant, en tant qu'ingrédient actif, un composé défini dans la revendication 1, 2, 3 ou 4 et un ou plusieurs diluants ou véhicules pharmaceutiques.

- 6. Une composition pharmaceutique sous forme d'une dose unitaire d'administration selon la revendication 5, dans laquelle l'ingrédient actif est présent en une quantité de 0,1 à 100 milligrammes par dose unitaire d'administration.
- L'utilisation du 3-[4-[4-(2-méthoxyphényl)-1-pipérazinyl]-1-butyl]-1H-indole et ses sels d'addition d'acides pharmaceutiquement acceptables pour la préparation d'un médicament ayant une activité sérotoninergique.
- 8. Un procédé pour la préparation d'un composé défini comme dans la revendication 1 qui comprend : a) la réduction du carbonyle d'amide d'un composé de formule II

$$R_1 \xrightarrow{X} (CH^5)^3 C - N \xrightarrow{N - V} V - V$$

dans laquelle R<sup>1</sup>, R<sup>2</sup>, X et Ar sont définis comme précédemment ; b) l'alkylation, l'acylation ou l'arylation d'un composé de formule III

avec un halogénure d'alkyle, d'acyle ou de phényle R<sup>2</sup>X où R<sup>1</sup>, X et Ar sont définis comme précédemment, l'acylation du groupe NH avec un chlorure d'acide carboxylique suivie d'une réduction de l'amide fournissant également les composés de structure I; c) l'alkylation d'une arylpipérazine

avec un agent d'alkylation de formule IV suivante :

10

20

25

30

40

50

55

$$R' = \bigcup_{\substack{N \\ N \\ R^2}} (CH_2)_4 - L$$

dans laquelle R<sup>1</sup>, R<sup>2</sup> et X sont définie comme précédemment, tandis que L est un groupe labile, par exemple halogène, mésylate ou tosylate ;

d) la réduction de la double liaison 2-3 d'un dérivé d'indole ou d'indazole de formule V suivante :

dans laquelle R1, R2, X et Ar sont définis comme précédemment ;

5

10

15

20

25

30

35

45

50

e) l'oxydation d'un dérivé d'indole de formule VI en un dérivé de 2-indolone de formule VII :

f) la réalisation d'une réaction de cyclisation de l'hydrazone VIII en le dérivé d'indazole IX :

le composé de formule I formé étant ensuite isolé sous forme de la base libre ou d'un de ses sels d'addition d'acides pharmaceutiquement acceptables et, si on le désire, séparé en les isomères optiques individuels.

 Un procédé selon la revendication 8, dans lequel le composé préparé est défini comme dans la revendication 3.

# Revendications pour les Etats contractants suivants : ES, GR

1. Un procédé pour la préparation d'un composé de formule suivante :

dans laquelle le pointillé indique une double liaison facultative ;

X est CH, CH<sub>2</sub>, N(H) ou C = 0;

R¹ est un hydrogène, un halogène, un alkyle inférieur, un alcényle inférieur, un trifluorométhyle, (un alkyle inférieur étant défini comme ayant 1 à 6 atomes de carbone et étant ramifié ou non ramifié);

R<sup>2</sup> est un hydrogène, un alkyle ou un alcényle inférieurs (jusqu'à 6 atomes de carbone inclusivement, ramifiés ou non ramifiés) facultativement substitués avec un ou deux groupes hydroxy, un groupe hydroxy quelconque présent étant facultativement estérifié avec un acide carboxylique aliphatique ayant de 2 à 24 atomes de carbone inclusivement, ou l'un quelconque des groupes acyles suivants :

dans lesquels R³ et R⁴ sont un hydrogène, un alkyle (1 à 20 atomes de carbone) ramifié ou non ramifié, un cycloalkyle (3 à 6 atomes de carbone), un adamantyle, un aralkyle (4 à 13 atomes de carbone inclusivement) ; Ar est

où Y est O ou S; Z est O, S ou CH<sub>2</sub>; n est 1, 2 ou 3; R<sup>5</sup> est un hydrogène, un alkyle ou un alcényle inférieurs (jusqu'à 6 atomes de carbone inclusivement, ramifiée ou non ramifiés); et R<sup>6</sup> est un hydrogène ou un groupe Y'R<sup>5</sup>', où Y' est O, S ou CH<sub>2</sub> et R<sup>5</sup>' est un hydrogène, un alkyle ou un alcényle inférieurs (jusqu'à 6 atomes de carbone); ainsi que ses sels d'addition d'acides pharmaceutiquement acceptables et ses stéréo-isomères, sous réserve que Ar ne peut pas être un 2-méthoxyphényle lorsque R¹ et R² sont tous deux un hydrogène, X est CH et le pointillé représente une liaison, qui comprend

a) la réduction du carbonyle d'amide d'un composé de formule II

- 2. Un procédé selon la revendication 1, où le composé répond à la formule 1 dans laquelle R¹ est un hydrogène, un halogène ou un trifluorométhyle, R² est un hydrogène ou un méthyle, Ar est un 2-(alcoxy inférieur)phényle, un 1,4-benzodioxanne-5-yle ou un 2,3-dihydro-7-benzofurannyle, et X est CH₂, C = O ou N(H); ainsi que ses sels d'addition d'acides pharmaceutiquement acceptables et ses stéréo-isomères.
- Un procédé selon la revendication 1, où le composé de formule I est choisi parmi les suivants : 3-[4-[4-(1,4-benzodioxanne-5-yl)-1-pipérazinyl]-1-butyl]-1H-2,3-dihydro-indole 3-[4-[4-(2,3-dihydro-7-benzofurannyl)-1-pipérazinyl]-1-butyl]-1H-2,3-dihydro-indole 5-chloro-3-[4-[4-(2-méthoxyphényl)-1-pipérazinyl]-1-butyl]-1H-2,3-dihydro-indole (+)-3-[4-[4-(2-méthoxyphényl)-1-pipérazinyl]-1-butyl]-1H-2,3-dihydro-indole (-)-3-[4-[4-(2-méthoxyphényl)-1-pipérazinyl]-1-butyl]-1H-2,3-dihydro-indole ainsi que leurs sols d'addition d'acides pharmaceutiquement acceptables.
  - 4. Un procédé selon la revendication 3, où le composé est le 3-[4-[4-(1,4-benzodioxanne-5-yl)-1-pipérazinyl]-1-butyl]-1H-2,3-dihydro-indole, ainsi que ses sels d'addition d'acides pharmaceutiquement acceptables.
  - L'utilisation du 3-[4-[4-(2-méthoxyphényl)-1-pipérazinyl]-1-butyl)-1H-indole et ses sels d'addition d'acides pharmaceutiquement acceptables pour la préparation d'un médicament ayant une activité sérotoninergique.
